Imperial*

The people of IMPERIAL AMMUNITION are specialists with decades of extensive experience in manufacturing ammunition for sportsmen, law enforcement agencies and Canadian military use.

The IMPERIAL or CANUCK name on ammunition is your guarantee of excellent value, consistent accuracy and dependable all-weather performance in the field or on the target range.

Consistent performance of ammunition doesn't just happen. It is built into every single cartridge through careful selection of metals, plastics, powders and other materials, excellent workmanship, strict adherence to rigid quality standards and constant dedication to technical improvement.

Protect your hunting privilege

Ask the landowner for permission to hunt A hunting licence doesn't automatically give the right to enter private property.

Leave behind nothing but your tracks Inconsiderate use of someone else's property quickly makes all hunters undesirable visitors. Don't leave a trail of open gates, ammunition boxes and empty shells, lunch wrappers or other trash.

Handle firearms properly, shoot with consideration Careful handling of firearms is one mark of a good hunter.

Be sure of your target

Avoid any chance of an accident, make certain you shoot at legal game only, know that the background is safe.

Care for your game properly

Clean, cool and transport birds and animals properly to prevent spoilage, avoid unnecessary public display of dead game.

Leave some for tomorrow

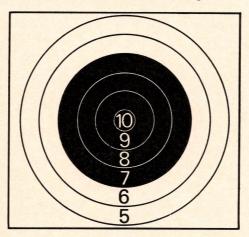

Take only what you can use, don't consider you have to shoot the limit every time.

Hunting is more than just shootingGood companions, the challenge of the hunt, closeness to nature and wildlife, all help make hunting a special kind of recreation.

Do your part

Your actions in the field will affect the future of hunting. Be a credit to the sport, and set an example for your companions to follow.

Target practice pays

It's no secret that the most successful hunters are those who can shoot best and have developed skillful handling of their rifle or shotgun.

One sure way to develop expert shooting skills and to keep them sharp between hunting seasons is by regular target practice. Even a few pre-season shots at clay targets will help maintain familiarity with a shotgun

and aid in bagging more game with fewer shells. Checking the sight setting of a big game rifle not only ensures it will hit where aimed, but also provides an opportunity for actual use of the rifle under shooting conditions.

In addition to being a smart way for the experienced hunter to maintain skills, supervised target shooting can be used to advantage in training new hunters. It has a particular appeal that helps make lessons in gun care and handling interesting, as well as developing marksmanship.

IMPERIAL Ammunition operates the IMPERIAL Shooting Sports Program, which offers a series of qualification awards for 22 Sporting Rifle, Pistol, Skeet and Trap shooting. These awards are free and targets for 22 Sporting Rifle are also supplied without charge to affiliated clubs. For information, write to:

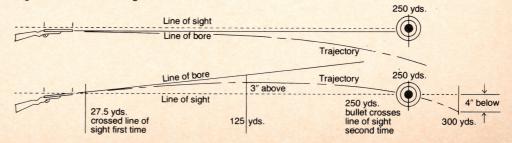

IMPERIAL Shooting Sports Program 1010 Sherbrooke St. W., Suite 608 Montreal, Quebec H3A 2R7

Sighting in your rifle

Bullets do not travel in a straight line but in a curve called the 'trajectory' of the bullet. As a consequence, the bullet begins to drop below the line of a horizontal bore as soon as it emerges from the muzzle. The muzzle then, must be pointed up slightly so the bullet will rise above the line of sight. This is accomplished by having the rear sight a little higher than the front sight.

The bullet crosses the line of sight twice, once near the muzzle and again at some distance from the muzzle. Where the bullet crosses the line of sight the second time is the range for which the rifle is "sighted-in".

It is important that you sight in with the ammunition you are going to use in the field.

Recommended shot sizes

| Foxes | BB | | |
|-------------------|------|------|------|
| Jack Rabbits | 4 | 2 | BB |
| Ducks, Rabbits | 6 | 5 | 4 |
| Geese | 4 | 2 | BB |
| Upland Game Birds | 8 | 71/2 | 6 |
| Snipe, Woodcock | 9 | 8 | 71/2 |
| Crows | 71/2 | 6 | |
| Clay Targets | 9 | 8 | 71/2 |

Patterning a shotgun

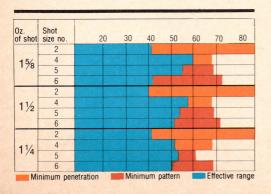

The common method of patterning a shotgun is to fire at a sheet of wrapping paper about four feet square at a range of 40 yards. Then draw a circle 30" in diameter so as to enclose the greatest number of pellet holes. Count the number of holes and calculate their total as a percentage of the number of pellets in the load. It is best to fire a number of patterns (at least five) and to average the percentage results. For example if you fired a 1 1/4 oz. load of No. 5 shot, and counted 150 pellets in a 30" circle, that test would be giving you about a 70% pattern (150/215 x 100%)-a full choke. Try repeating the test with other loads and shot sizes so that you will know just what your gun will do.

Effective range of shotshells

The effective range of a shot charge is the lesser of the range of minimum penetration or the range of minimum pattern.

Referring to the chart, the shaded area shows the effective range of various loads. Note that the minimum pattern of Nos. 2 and 4 shot is the factor governing effective range while minimum penetration is the governing factor with Nos. 5 and 6 shot.

The yardages shown are approximate for long range shotshells.

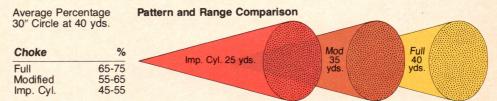

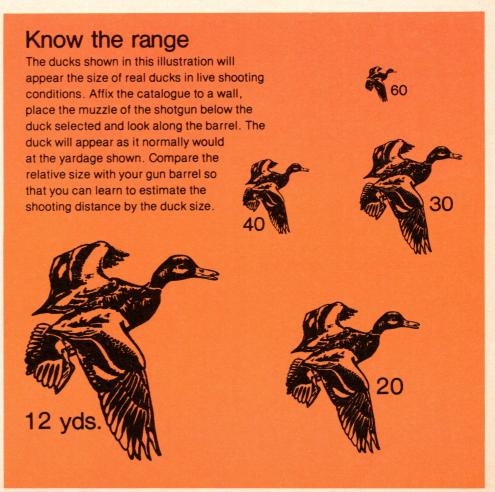

Standard shot sizes

| Standard shot size | | Pellet Dia. ins. | Pellets per oz. | Buck shot sizes | | Pellet dia. ins. | Pellets per oz. | U.S. equiv. |
|-----------------------|---|---------------------|-----------------|-----------------|---|------------------|--------------------|-------------|
| 9 | • | .080 | 585 | AAA | • | .22 | 27 | 4 Buck |

Illustration, diameter and number of pellets per ounce are approximate.

Shotgun chokes pattern and range

Imperial® The complete shotshell line.

Imperial® shotshells

IMPERIAL special long range. For waterfowl and long range upland game. Speed, power and long reach.

IMPERIAL 23/4" magnum. 20% more shot, denser more effective patterns on high flying ducks and geese.

IMPERIAL 3" magnum. Maximum shot charge and high velocity for extra reaching power.

IMPERIAL "poly-kor" and rifled slugs and buckshot loads. For medium size game at short range.

CANUCK® standard load.

General-purpose light load for short range birds, upland game or pests.

TARGET LOADS. Uniform patterns, light recoil for competition or practice.

There's a shotshell in the IMPERIAL ammunition line for every kind of shotgun shooting, whether it's long-range waterfowl, snap-shots at grouse in the brush, or clay target Skeet and Trap shooting.

Each type of load is designed and manufactured with a carefully balanced charge to produce the optimum combination of velocity and pattern at the target.

One reason for the exceptionally uniform performance of IMPERIAL, CANUCK and Target Load shotshells is the highly efficient DYNAWAD plastic wad system. The DYNAWAD incorporates two gas seals, one at the bottom of the wad column and a second on the light, tough shot protector. These seals ensure all of the powder gas pressure is properly controlled to propel the shot charge, while the shot protector shields the pellets against damage in the barrel and concentrates them into a uniform pattern.

The DYNAWAD isn't the only reason IMPERIAL shotshells perform consistently. Every one is made from material that's been selected to give the best possible results when formed into components developed through extensive research. Continual checking with modern scientific equipment ensures that all specifications are maintained right from the raw material stage through to the finished shotshell.

Good shooting demands ammunition that can be counted on, shot after shot, under all conditions. IMPERIAL, CANUCK or Target Load shotshells will deliver the performance you need, whatever your target.

Imperial® centrefire cartridges

Canuck® centrefire pistol and revolver cartridges

*See "*Ballistics" page 7

Ammunition for hunting must be accurate and must deliver the shocking power that comes from balanced velocity and bullet expansion. It must function properly in the rifle as well.

The bullet is often considered the most important part of a rifle cartridge.

Distances and shooting conditions demand various bullet designs and constructions. Short range shots require a heavy bullet, whereas a long range shot demands a lighter, pointed bullet.

Other important components of centrefire cartridges include: **the brass case** which must be dimensionally and uniformally exact; **the powder** which is selected to produce the proper combination of velocity and pressure; and **the primer** which must fire at all temperatures.

Imperial® centrefire bullet types

Three IMPERIAL bullets that have been proven through use are the "Kling-Kor", "Sabretip" and "Pointed Soft Point".

Expansion of the "Kling-Kor" Soft Point is controlled even on short range shots, Hidden notches in the bullet jacket lock in the lead core to ensure greater weight retention for deep penetration with the bullet mushroomed to maximum diameter.

The "Sabretip" combines a tough jacket and core, excellent ballistic shape, and a durable tip that resists deformation in the magazine or during feeding into the rifle chamber. All these characteristics make it an excellent bullet for all-round use.

Lighter weight and construction, together with a sharply pointed shape make the "Pointed Soft Point" bullet ideal for long-range shooting, especially at small-sized game and varmints where rapid bullet expansion is needed.

KKSP 'Kling-Kor' Soft Point

ST 'Sabretip'

PSP Pointed Soft Point

*Ballistics

Popular

The bullet velocity, energy, trajectory, and range information shown was obtained with standard test equipment in ballistic laboratories, and from range firing using normal firearms and sights.

Ammunition performance is influenced by weather conditions such as temperature, barometric pressure, wind velocity and direction, and by age, dimensions or other characteristics of individual firearms. Results obtained in the field may therefore differ.

| Centre fire pistol and revolver | Bul | let† | Velocity Ft/Sec. | Energy FtLbs. |
|---------------------------------|------|------|---------------------|------------------|
| cartridges | Туре | Wt. | | Muzzle* |
| 9 mm Parabellum | МС | 115 | 1120 | 345 |
| 38 Special | WC | 148 | 770 | 195 |
| 38 Special (Lead) | LD | 158 | 855 | 255 |
| 38 Special (+ P) | swc | 158 | 1090 | 420 |

CAUTION: Ammunition with a (+P) marking on the case headstamp is loaded to a higher pressure. Use (+P) cartridges only in firearms designated for this ammunition and so recommended by the gun manufacturer.

Range Table * Values shown in this table are based on a sight height 1½" above line of bore.

RECOMMENDED SIGHTING: O indicates the most favourable sighting range in order to minimize the sighting problem at shorter and longer ranges. + indicates inches high; — indicates inches low.

†Bullet weight may vary slightly

Imperial® 22 rimfire cartridges

The little "twenty-two" calibre rimfire cartridge seems to be a simple, uncomplicated product, yet it's a highly specialized type of ammunition requiring just as much care and attention in manufacture as do the much more powerful centrefire rifle cartridges and shotshells.

Too, there's probably been more research effort directed towards the "twenty-two" over the years of its existence than any other cartridge, with the result it now heads the accuracy list.

High accuracy, low firing report, negligible recoil and modest cost all

contribute to the "twenty-two's" popularity. There's a variety of types available as well, which allows the selection of a cartridge for a particular use whether it be target shooting or game hunting.

IMPERIAL High Velocity ammunition available in Short, Long and Long Rifle types is ideal for general target shooting and small game. Use of the Hollow-Point bullet in Long Rifle is recommended for small game and pests where maximum impact is needed.

The IMPERIAL TARGET cartridge in Long Rifle type is specially manufactured to

meet the requirements of target shooting with either rifles or pistols. The case, bullet, powder and priming are all designed for reliable functioning and high accuracy in target firearms. Standard level bullet velocity is carefully maintained within narrow limits for minimum variation from shot to shot, lessened wind effect and uniform trajectory. A precisely shaped bullet with copper plating and unique lubricant aids in cartridge chambering especially in auto-loading pistols, reduces friction and fouling, and as a bonus, is particularly clean to handle.

22 Short

Shorter case and 29 grain bullet. Can be used in firearms with Long Rifle chambers, but best performance is obtained from firearms specially made for the Short cartridge.

22 Long

Combines a Long Rifle case and Short bullet at high velocity. Particularly suitable for general shooting with firearms having Long Rifle chambers.

22 Long Rifle

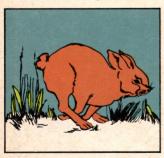

The most popular "Twenty-two"; for best performance and highest accuracy when shooting small game, pests or targets. "High Velocity" ammunition available with either 40 grain solid or 36 grain Hollow Point bullet.

"TARGET" cartridges are loaded to standard velocity, with a 40 grain solid bullet.

Competitive target shooting

Use IMPERIAL TARGET 22's Standard Velocity

Small game and varmints
Use Imperial High Velocity
